Senior software engineer with 10 years of experience designing and operating cloud-backed software systems used by millions of users. Expertise in backend development, distributed services, compliance, telemetry, and AI-powered features across Azure and AWS.

EXPERIENCE

Senior Software Engineer (contract) – TerraClear (Issaquah, WA)

January 2026 – April 2026

- Short-term contract on TerraClear's new offering, an autonomous field mapping robot. In my first two weeks, I built a network diagnostic Android app, and then went on to set up various support systems, including a time server monitoring service, overhaul of the AWS lambda/SQS-based pipeline, and rework of the C++ camera driver. This supported the upcoming launch of the machine, allowing for easier in-field maintenance and operation.

Senior Software Engineer – Microsoft (Redmond, WA)

September 2023 – August 2025

- Pioneered new AI-powered features to let users deepen their relationships with colleagues, in one of the first teams to adopt AI at Microsoft; authored experiment specs, led telemetry reviews, researched prompts, architected components, and integrated AI components to support Microsoft's agentic Copilot strategy.
- Spearheaded privacy and security compliance reviews, leading internal assessments and implementing GDPR-compliant attribution and consent mechanisms. Steered cross-functional working groups to complete reviews and obtain regulatory approval for new features, enabling their launch.
- Championed diversity & inclusion and team culture, founding the Colleague Spotlight presentation series (presented to 1200+ FTEs), designing the Shield Improvement Process (cutting on-call time by 40%), and facilitating impactful cultural sessions on mental wellbeing and equity.

Software Engineer II – Microsoft (Redmond, WA)

January 2020 – September 2023

- Led the integration of backend, frontend, and telemetry components in a new integration of a global knowledge management product, Viva Topics, a part of Microsoft's flagship Viva suite of employee productivity systems.
- Drove several improvements to enrich users' profile by leveraging LinkedIn information. Reduced API calls by 97% and added information to 11% of sparse profiles.

Software Engineer I – Microsoft (Oslo, Norway)

January 2018 – December 2019

- Transitioned the service powering Live People Cards (LPC, a microservice-based product with 300M daily active users) to a new system to perform A/B tests and staged rollouts. This involved implementing this feature and then transitioning ~160 ongoing experiments without service disruption.
- Helped migrate to a new version of LPC, achieving 80–90% coverage across clients, improving performance, reducing maintenance costs, and enabling AI extensibility across Outlook and Teams. Among other tasks, this involved porting mobile clients and deploying a new Azure Data Factory-based telemetry system.

System Engineer – Ayfie AS (Oslo, Norway)

January 2016 – December 2017

- Worked on third-party integrations into the company's main offering, an enterprise search software.
- Initiated and implemented an AWS EC2-based automated testing system to free developer hours and improve quality.

EDUCATION

Linnaeus University — Växjö, Sweden

Selected master courses in Web Technologies

University of Nantes — Nantes, France

Bachelor degree: Computer and Software Systems – specialty: Distributed Application Development

SKILLS

Backend: .NET (C#), Java, Kotlin, Python, REST APIs, caching, scalability, monitoring

Frontend: Typescript / Javascript, React, GraphQL, HTML / CSS, accessibility

Data: SQL, Azure / AWS (EC2, SQS, S3, Lambda, etc.), Docker, Azure Data Factory, networking

Methodologies: Scrum, Git, Azure DevOps, systems architecture, mentoring, knowledge sharing

PERSONAL PROJECTS

In my spare time, I like to work on projects that integrate software and hardware. For instance, I built an automated citrus grove in my spare bathroom. You can read about it and other projects on my website, <https://timothy-daniel.com/>
